

Detail: Upper left corner
 $\frac{1}{2}'' = 1''$

$\frac{1}{8}''$ holes on $\frac{1}{4}''$ grid. Outer hole edges are 1" from panel edge, so hole centers are $1 \frac{1}{16}''$ from panel edge. Notice the spaces where holes are absent.

All other sets of holes are identical respective to the corner they are located in.

Note: The piece of metal that this is made out of is not actually square, as the edges are folded over thus giving these outer dimensions. The piece of metal is about 1 inch larger in both outer dimensions, with the corners cut angularly such that the edges can be bent over. The bent over flap of metal is $\frac{1}{2}''$ inch. The corners are not perfectly square due to the folded edges, and are thus actually slightly rounded.

Also note that this drawing is $\frac{1}{4}''$ scale in theory, but probably not perfectly so in actuality, which is why all the dimensions have been exhaustively documented.
